

Hex Rules

Equipment

- A board made from a grid of hexagons in the shape of a rhombus.
 - Commonly 11x11 hexes per edge.
 - Smaller boards can be used for beginners.
 - Larger boards for advanced play.

One opposite pair of sides labelled red, the other pair blue.

The 4 corners hexes are considered as both red and blue.

- A sufficient supply of red and blue counters.
For an 11x11 board, 61 of each colour might be needed, though likely to be less.

Object of the Game

- Red to connect the red sides of the board with a contiguous path of hexes, joined edge to edge, using red counters.
Blue to connect the blue sides of the board with a contiguous path of hexes, joined edge to edge, using blue counters.

The Play

- Player to go first chosen at random.
- Each turn consists of placing a counter of your colour on any vacant hex.
- Once placed, counters are never moved.

Advanced Rule

- To negate the potential advantage that the first player has with an extra counter on the board, the so called 'pie' or 'swap' rule is often used.

The first player A plays on any hex. If the second player B thinks this is an advantage, they can swap colour and B becomes the first player, with the counter already placed as their first move.

(So, the first player must try to place the first counter so that neither player has an advantage in the game. This probably means not too near the centre of the board, which would be an advantage that could be swapped, but not too near the edge, which would be a disadvantage.)
